

Tethered Phone and Wearable Alarming

At Endur ID Inc. we take interrupted wearable/phone communication seriously. A goal of our BlueTrac® product is to provide real time alarming to parolees and Electronic Monitoring (EM) staff if and when a parolee inadvertently or purposefully tries to separate themselves and their wearable from their phone or attempts to place the phone on Mute or Do-not-Disturb (DND) modes. When separation occurs beyond approved range or the phone is attempted to be placed on Mute, BlueTrac® provides a max volume audible alarming that is virtually impossible to ignore and initiated within 2-3 seconds when such a separation occurs. Idle claims of not being aware of such separations are met with all-in-one device level corrective action. Parolees are given the opportunity to immediately correct an inadvertent separation with their phone and a swift intervention from EM monitoring staff when it's malicious in nature.

To learn more about this Parolee EM oversight and management tool, please contact us here at Endur ID Inc.
